Section 1: Introduction to different Payment Mechanisms

According to the World Health Organization (WHO), there are several methods available to pay the healthcare providers used by health care systems around the world.

This section looks at ‘What is the difference between these methods and what are their advantages and disadvantages?’ The focus is on inpatient payment mechanisms.

Different ways of reimbursing providers for inpatient episodes

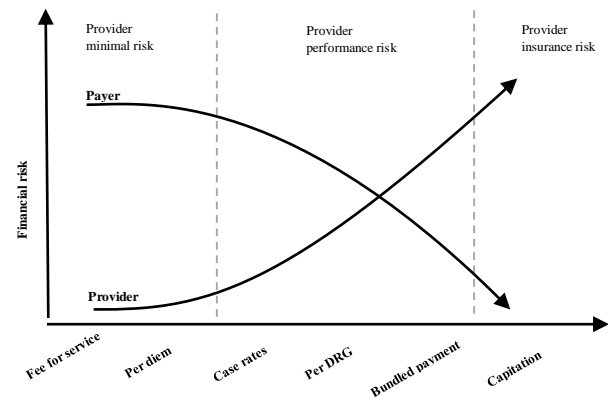

Provider Reimbursement Mechanisms

Fee for Service	Payment for each service utilised
Per diem	An all-inclusive per day payment
Case Rate	An all-inclusive fixed amount for the whole admission
Per DRG	A set amount or relative weight for a group of surgeries or medical diagnosis.
Bundled Payment	A single payment for inpatient admission as well as follow up care
Capitation	A per member payment for all medical or surgical services for a period.
Global budget	A block budget payment for a population group.

According to the WHO, there are several methods to pay for the healthcare providers used by health care systems around the world.

As providers, payers and patients alike recognise that the current healthcare financing framework in the Middle East – a predominantly fee-for-service environment – is not sustainable, a key focus for reform in the region is developing high value provider reimbursement models that tie healthcare

spending to the achievement of the best possible health outcomes.

Broadly, each of the payment methods results in a different set of responsibilities for both payers and providers. Fee-for-service reimbursement does not encourage providers to take full responsibility for efficiency or clinically standardized care as reimbursement is based on each service utilised (i.e. more services = more payment). Capitation and global budgets at the other end of the spectrum require providers to assume full responsibility for the overall health management of a population as they receive a fixed amount (per member or per

cohort) for the care irrespective of the actual use. A DRG payment system encourages providers to become efficient and maintain the profit margins under fixed prices and

share the financial responsibility with the payers (i.e. efficient services = same payment = maintain profit margin).

Fee for Service

Providers receive fixed amount for each kind of service

Fee-for-service (FFS): Under this payment system, providers receive fixed amount for each kind of service.

The number of services provided is the main factor in determining the amount to be paid to the providers, which is considered a strong incentive to provide more services than strictly required, especially the valuable items.

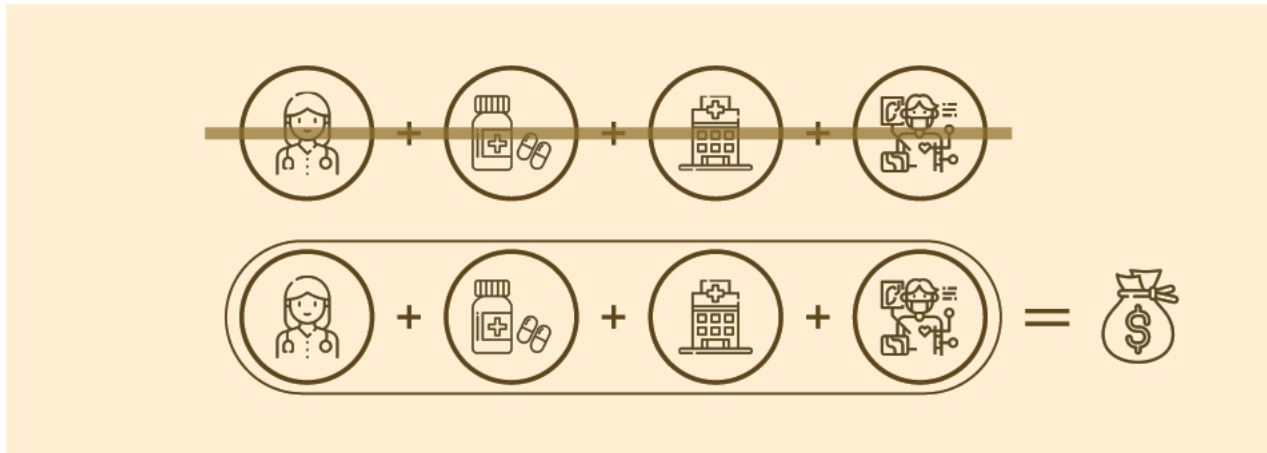

FFS is considered the weak tool for cost containment. There is no incentive to manage efficiency or cost containment.

However, a FFS system allows for more granular data, and there is transparency in what services were used in the care. It can encourage physicians to undertake more efforts to deliver a higher quality of healthcare services so that they attract more patients as these additional services are paid.

Diagnosis related groupings

Providers receive fixed amount for treating a specific case (i.e., disease/ surgery)

Diagnosis Related Groupings: *The DRG-system is a patient classification system established to categorize patients into clusters which are economically and medically comparable, and are expected to have similar hospital resource use and expenses.*

Based on the final diagnosis for the admitted patient, the providers will be reimbursed at a prospective fixed rate per discharge according to the diagnosis and severity of the case.

The payment is fixed irrespective of the actual services provided. A different rate may become applicable in case of complications or co-morbid conditions.

The DRG framework is considered a suitable instrument for cost control. This system incentivises the providers to deliver services as cost-effectively as possible with the minimum possible duration of stay in the hospital. This system shifts the risk to providers to manage efficiency at the point of care. Physicians have to justify variation in care or additional services outside the expected bundle of care, thereby encouraging clinical justification.

However, the DRG system has a potential risk related to premature discharges, or the provider selecting the patients with low-cost, and avoiding complex conditions.

Capitation model

Providers receives a fixed amount per patient treated (depending on age and risk factor)

Members	PMPY	Count	
	\$XXX	×	YYY
	\$XXX	×	YYY
	\$XXX	×	YYY
Total	=		

Capitation: A fixed amount of money is paid to the providers to deliver a variety of services. The fixed payment is based on the number of patients. Under this payment system, the providers get a fee for each individual enrolled to cover a defined package of services for a certain period. The fixed amount may vary by age or gender or other local factors.

This payment system incentivizes improved coordination of care and overall population

health management. It encourages providers to prioritise prevention, post-acute care etc., alongside inpatient care, for the overall wellbeing and care of members.

However, under this system, physicians have a strong incentive to select healthy individuals who require less visit and less cost. Physicians may avoid expensive treatment and refer patients to higher level of care to save on operating costs.

Move from volume to value of care

A DRG system encourages a shared responsibility between payer and provider.

	Fixed Salary*	Capitation	Fee-for-Service	Case based reimbursement
Physicians have appropriate incentives to provide the optimal quantity of care and quantity of service	Limited	Limited	High	Limited
Physicians have appropriate incentives to keep costs down (cost control)	Low	High	Low	High
Patients are not denied access	High	Limited	Limited	Limited
Patients can exercise choice	Low	Limited	High	Limited
The payment system is easy to administer	High	High	Limited	Limited
The payment system requires a sophisticated information and cost accounting system	Low	Low	High	High
Unit of Payment	Monthly payment regardless of services rendered	Per patient for a fixed time period	Per service item	Per case for a specific encounter
Financial Risk	Low	Provider: High Payer: Low	Provider: Low Payer: High	Moderate

*under fixed salary payer covers the salary of physicians and all expenses like a budget based model.

Overall, each of the payment methods considered above carries a risk for both provider and payer but with different degree. With the drive to adopt value-based payment in the

Kingdom, a DRG based system allows a shift from volume-based payments (FFS) to a value-based payment mechanism - one that drives efficiency, cost control and quality of care.

Section 2: Introduction to Diagnosis-Related Groups (DRGs)

Payment for an inpatient hospitalization event through a single bundled payment for a diagnosis related group has been implemented in many countries globally. This section provides an overview of the DRG classification and dives deeper into the Australian Refined Diagnosis Related Groups adopted by the Kingdom.

Diagnosis Related Grouping

Definition and principles

A diagnosis-related group (DRG) is a patient classification system that standardizes prospective payment to hospitals based on each patient's clinical profile and the resources used for patient care

DRGs were introduced in other international health systems primarily for four reasons:

- To introduce and increase transparency;
- To enable management of resources;
- As a payment mechanism, i.e. the payers contract providers based on DRG volume and quality; and
- To create incentives to reduce cost and/or improve quality.

Diagnosis Related Groups (DRGs) are just one type of payment methods for the hospital where it gained its popularity after their adoption to be used in the national Medicare prospective payment system in late 1983 in the United State of America (Congress, Office of Technology Assessment, 1983). The Independent

Hospital Pricing Authority (IHPA Australia) has developed and maintains the Australian Refined Diagnosis Related Group system of classification (AR-DRG). There are various other diagnosis related groupers used in different countries based on the same principles.

This system is a per-case reimbursement technique under which inpatient admission cases are alienated into relatively similar categories named diagnosis-related groups (DRGs).

DRGs are a specific type of bundled payment where:

- Payment is aggregated per case: A single payment will cover all costs associated with a single inpatient admission, including ward, theatre, physician, laboratory, radiology and pharmacy costs.
- DRGs are mutually exclusive: each admission is allocated only a single DRG.

In a DRG prospective payment scheme, the payer pays a hospital a flat amount per claim for inpatient hospital care. This system provides effective and efficient hospitals a real reward and motivates other hospitals to become better organized and to improve their efficiency.

DRG allocation requires sufficient clinical information in the form of patient variables, like age and gender, and clinical information, like primary and secondary diagnoses, surgical procedures performed and any comorbidities and complications that may have developed during inpatient

care. The clinical information relies on standard codes specified for each grouper, for example International classification of diseases (ICD) and health intervention (procedure codes). Most DRGs may have further subcategories defined by the severity of the patient and these intermediate or complex severity DRGs may have higher relative weights or prices to account for the additional resources required.

DRG groupers are very carefully designed over a period by large organisations. The grouper and associated codes are regularly updated and maintained by these organisations.

The Kingdom has adopted the following versions of coding systems. These are part of the minimum data standards launched by CCHI earlier this year:

Diagnosis Related Groupings (DRGs) :

AR-DRG version 9.0 Grouper

Diagnosis Codes:

ICD-10-AM/ACS Tenth Edition

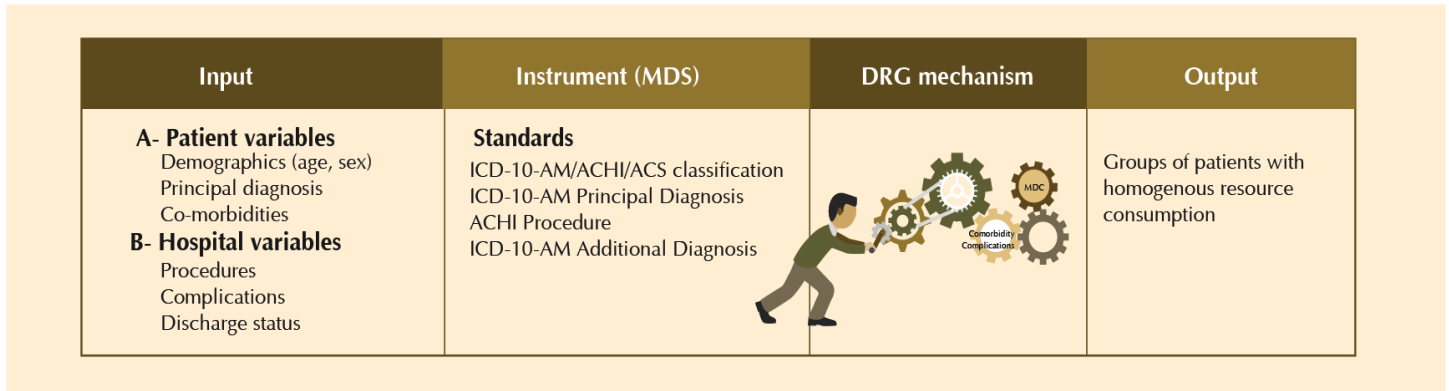

Procedures / Health interventions (in-patient):

ACHI Tenth Edition

Australian Refined Diagnosis-Related-Groups (AR-DRG)

DRG classification developed and maintained by The Independent Hospital Pricing Authority (IHPA Australia) as an inpatient classification system

Australian Refined Diagnosis Related Groups (AR-DRGs)

AR DRGs were primarily developed to form the basis for calculation of public hospital funding in Australia as well as many other countries.

They can also be used as the basis of prospective payment system between payers and providers. The AR-DRG system consists of about 800 patient classes and the allocated class can then be used to determine

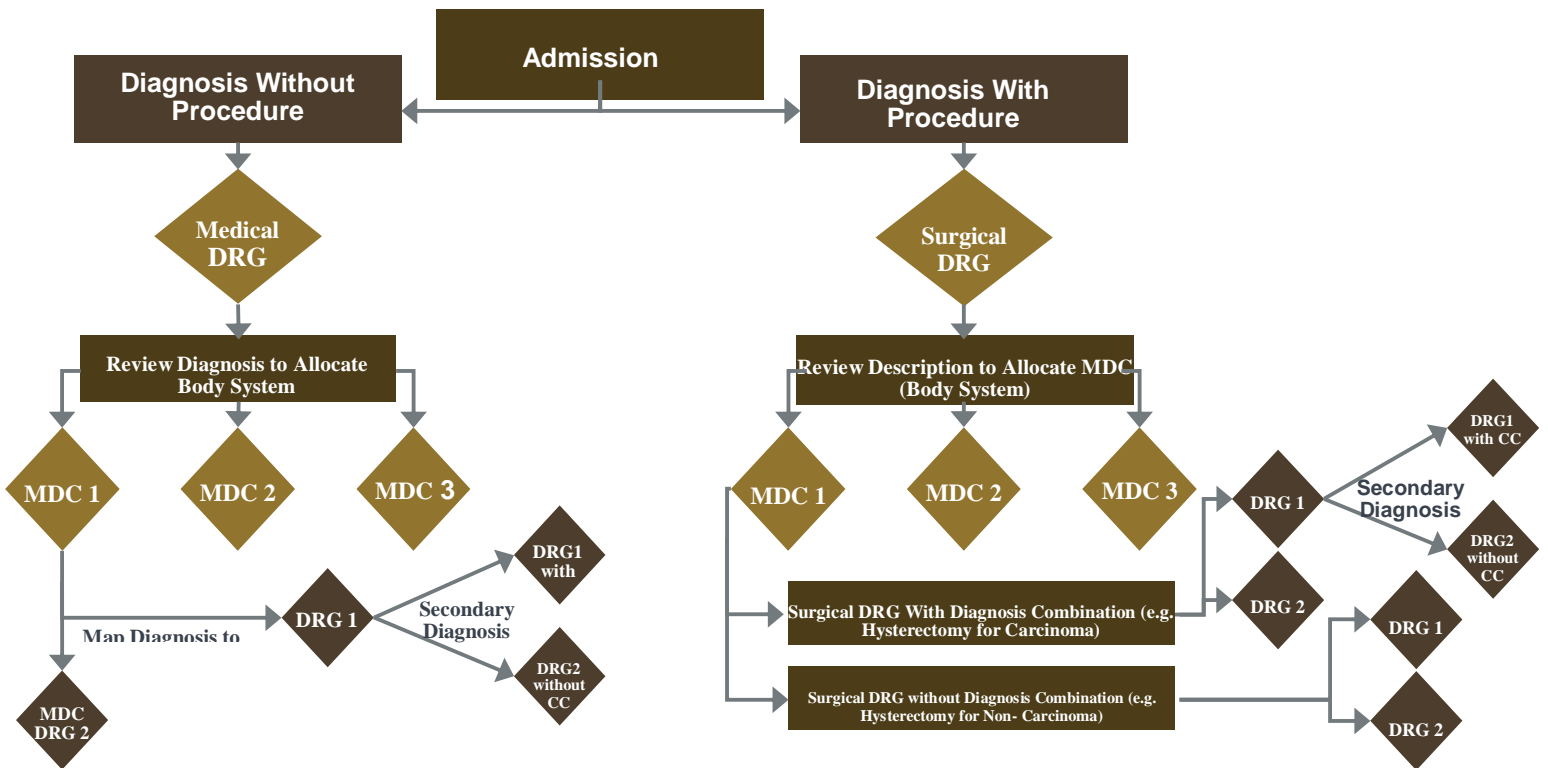

the relative weight value for a given patient admission and this in turn can be given a financial value.

A DRG Group program is generally used to determine which DRG is appropriately assigned for a patient's admission based on coded ICD diagnosis, additional diagnoses and procedural codes (of which there are over 24,000 ICD codes). *AR DRG rely on ICD 10 Australian modification and Australian clinical health intervention codes (ACHI).*

Process of DRG allocation

The grouper software carefully analyses patient and clinical information to allocate a mutually exclusive DRG

A DRG Grouper analyses the patient age, sex, and clinical edits (principal diagnosis, additional diagnoses, procedures) then sequentially:

- Assigns an MDC
- Performs pre-MDC processing
- Adjacent DRG (ADRG) assignment

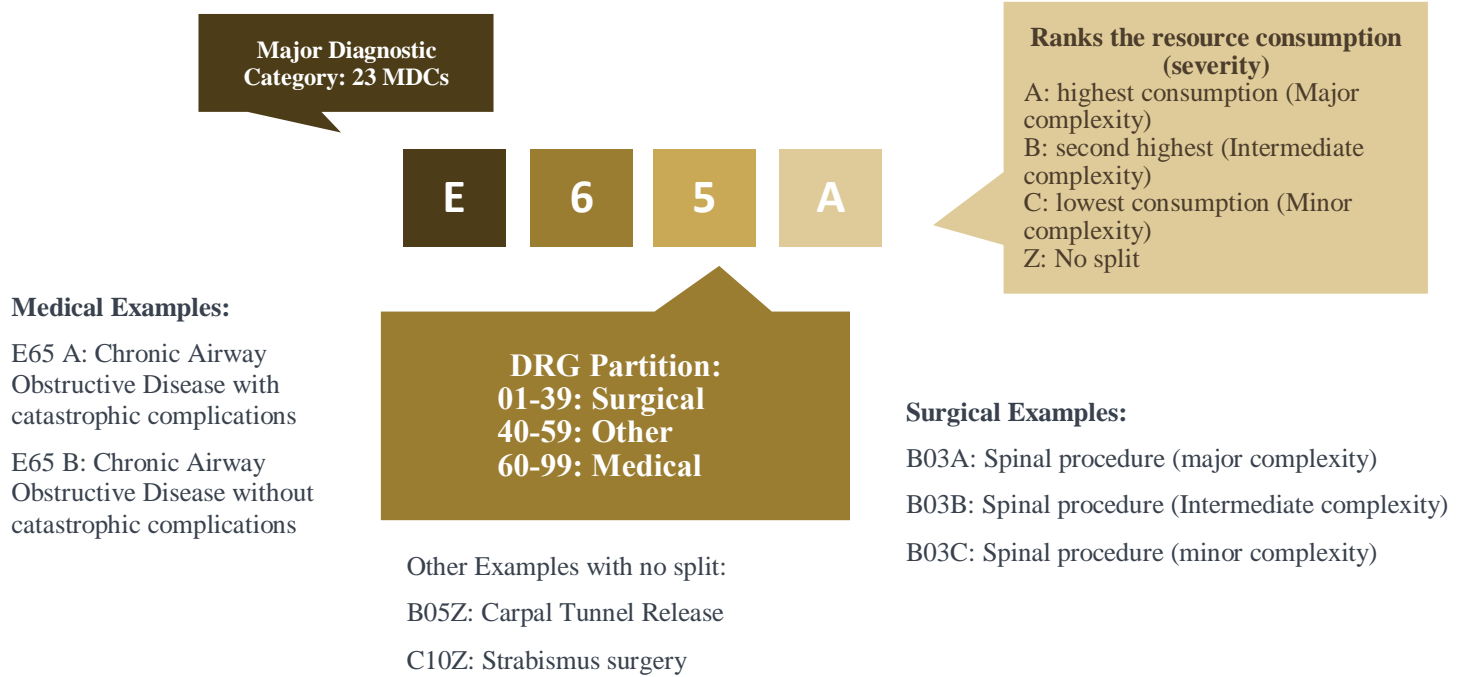

Complication and comorbidity level (CCL) and patient clinical complexity level (PCCL) assignment

- final DRG assignment

Anatomy of Australian Refined DRGs

AR-DRG follows a structured approach to the DRG code

1st character of a DRG code: **E**

The 1st character of a DRG code refers to the major diagnostic category (except for A = pre MDC, 8 = unrelated OR procedure, 9 = error)

B = neurology and cranial

Next 2 characters: **6** **5**

Identify the adjacent DRG and its partition, usually most to least complex:

x01x – x39x are surgical DRGs

x40x – x59x are other non-surgical procedural DRGs (e.g. endoscopy)

x60x – x99x are medical DRGs

Last character: **A**

Represents the resource consumption split within an adjacent DRG

The split is based on Patient Clinical Complexity Level (PCCL), malignancy,

same day status, MHLS, mode of separation, length of stay, and specific diagnoses or procedures

e.g. xnnA, xnnB, xnnC, xnnD, xnnZ

- A: highest consumption of resources (e.g. with catastrophic CC)
- B: second highest consumption of resources (e.g. with severe CC)
- C: third highest consumption of resources (e.g. without catastrophic or severe CC)
- D: fourth highest consumption of resources (e.g. died or transferred < 5 days)
- Z: no split for the ADRG

Other points to note:

- A diagnosis may have a different CCL depending on whether ADRG is medical or surgical, and on the ADRG itself. For example, hypokalaemia or hyperkalaemia may be 3 or 4 if

surgical, or 2 or 3 if medical fluid overload may be 2 or 3 and thereby a different PCCL assignment.

The DRG allocation may depend upon patient variables, for example:

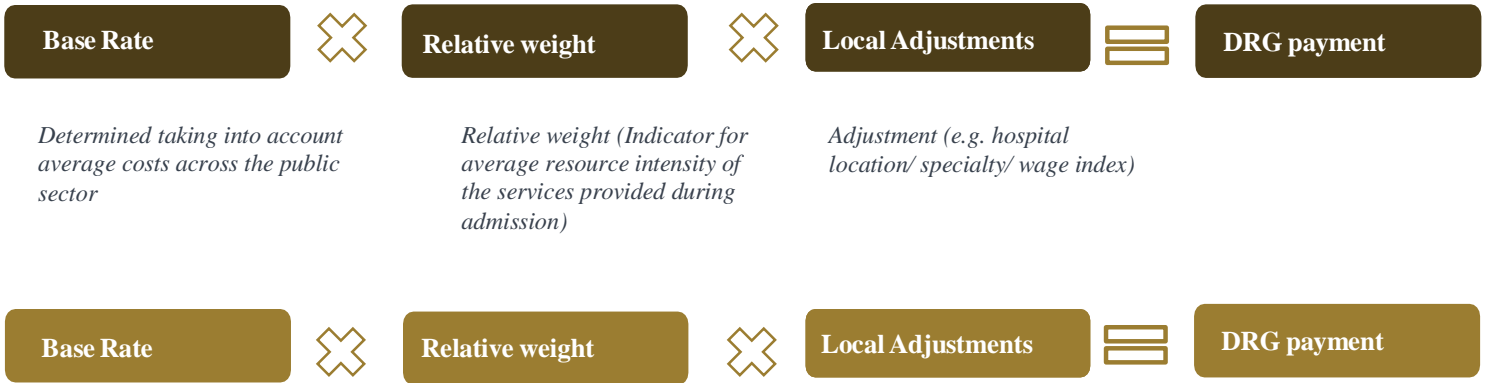

- Some DRGs are defined based on a specific service used in the care: F41 Circulatory Disorders, admitted for AMI W Invasive Cardiac Investigative Interventions; F60 Circulatory Disorders, Admitted for AMI W/O Invasive Cardiac Investigative Interventions
- Some DRGs are defined based on a specific diagnosis combination: N12 Uterus and Adnexa Interventions for Malignancy and N07 Other Uterus and Adnexa Interventions for Non-Malignancy
- Some DRGs are defined on the basis of length of stay or discharge disposition: I80 Femoral Fractures, Transferred to Acute Facility <2 Days

Australian Refined DRG Framework (AR-DRG)

Allows for reflecting the case mix or severity of patients across different providers

Calculation reference: for illustration purpose only

Different countries use different methods of applying DRG based payment mechanisms. DRGs have been used historically for budgetary allocation in many countries, especially in the public health financing. DRG based systems allow for identifying the complex case mix or severity of patients across different providers and allows for budgetary adjustments for providers responsible for more severe patients.

Illustration of DRG as the payment model

The DRG system provides the **relative weights** for each DRG which reflects the resource or cost intensity of that DRG.

This relative weight is applied to the **base rate** for a provider. A base rate can be the average cost (or price) of a typical inpatient admission payment.

A further **adjustment factor** can be applied to the base rate for a specific provider type (in line with a provider classification system). For example, a large teaching hospital in a city may be more expensive than a small hospital with no tertiary care infrastructure in a less expensive location; or an adjustment factor can be added to reward better

quality of patient care in a pay for performance initiative.

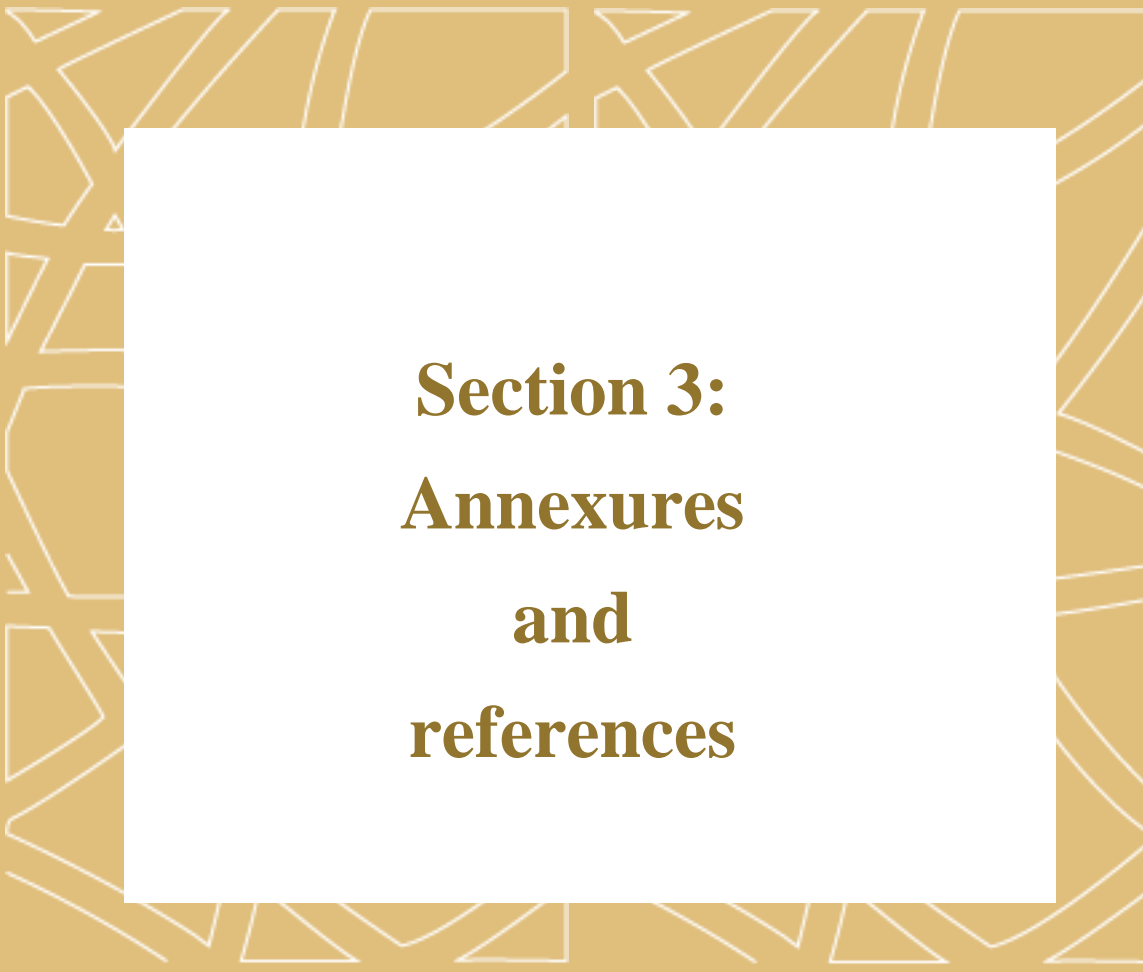

The final payment for a DRG would be based on:

- **Relative weight for a DRG** (including severity classification) **x**
- **Base rate** (nationwide average or for that cluster of peers) **x**
- **Adjustment factor** (specific to a healthcare provider based on cost / quality differentials).

In some markets the relative weights and base price are finalized for a specific level of care or a group of providers and the final amount is used as a fee schedule rather than a case mix index.

For example, a price schedule is finalised for each DRG including its severity for a secondary level healthcare provider and a different price schedule for each DRG is finalized for a tertiary level healthcare provider.
